Jeen Solution Engineer – Home Assignment

Congratulations on progressing to the next stage – this home assignment is designed to showcase your hands-on approach, technical judgment, and ability to translate real customer problems into practical AI agent workflows.

Overview

Jeen helps enterprises move from fragmented AI pilots to governed, production-grade AI by orchestrating data, agents, workflows, and models.

As part of this home assignment, you will take on the role of a Solution Engineer at Jeen, preparing a working demo of an AI agent for a customer meeting.

You may choose one organization from a relevant sector, such as:

- Financial services / insurance
- Healthcare
- Manufacturing
- Public sector / government

Your goal is to design and build a working demo that showcases one AI agent workflow tailored to that customer.

Deliverables

1) Build a Working Agent Flow

Use n8n, LangFlow, or a Similar platform

Your workflow should:

- Solve a real business problem (it can be a simple one, such as: Q&A assistant with actions, support request routing, profit report generation, etc.)
- Include at least one LLM-powered decision step
- Include at least one action (not just a chat response; a tool or integration would be ideal)
- Include a human-in-the-loop step if the use case is sensitive
- Be fully working – you will demonstrate it live and should be comfortable presenting it

Please provide:

- Exported workflow (n8n/Langflow)
- 1 screenshot of the full workflow
- 1-2 screenshots of a successful run
- Your dataset / documents (if used any)

2) Presentation

Prepare a short presentation (up to 5 slides) to demonstrate your work. Include:

Slide 1 – Customer Context & Problem

- Who is the customer
- What problem you chose
- Why it matters now

Slide 2 – Why This Use Case

- Current pain points
- Expected business value
- Why this should be prioritised

Slide 3 – Agent Workflow Overview

- End-to-end workflow
- Systems / data involved
- Where the LLM is used (what its role is)
- Where human approval is applied

What We Want To See

- Hands-on approach and comfort working with AI agents and tools
- Good judgement
- A relevant and well-chosen use case
- Clear and structured communication

Time Expectations

Max – 4 to 5 hours
